

D2F Report

Company	Northeast Natural Energy LLC
Well	Boggess 1H & 3H
Formation	Marcellus
Location	Monongalia, WV

Customer has full responsibility for use of this report and any accompanying diagrams inclusive of any data analysis, interpretation and recommendations. All analysis, reports and recommendations provided are opinions based on inferences, judgment, and empirical relationships with respect to which competent specialists may differ and Drill2Frac LLC does not warrant the accuracy and completeness of the analysis provided. Customer is fully responsible for any and all decisions that may arise out of data analysis and recommendations provided and Drill2Frac shall not be liable for any losses or damages that may arise by reason of Customer's use of deliverables.

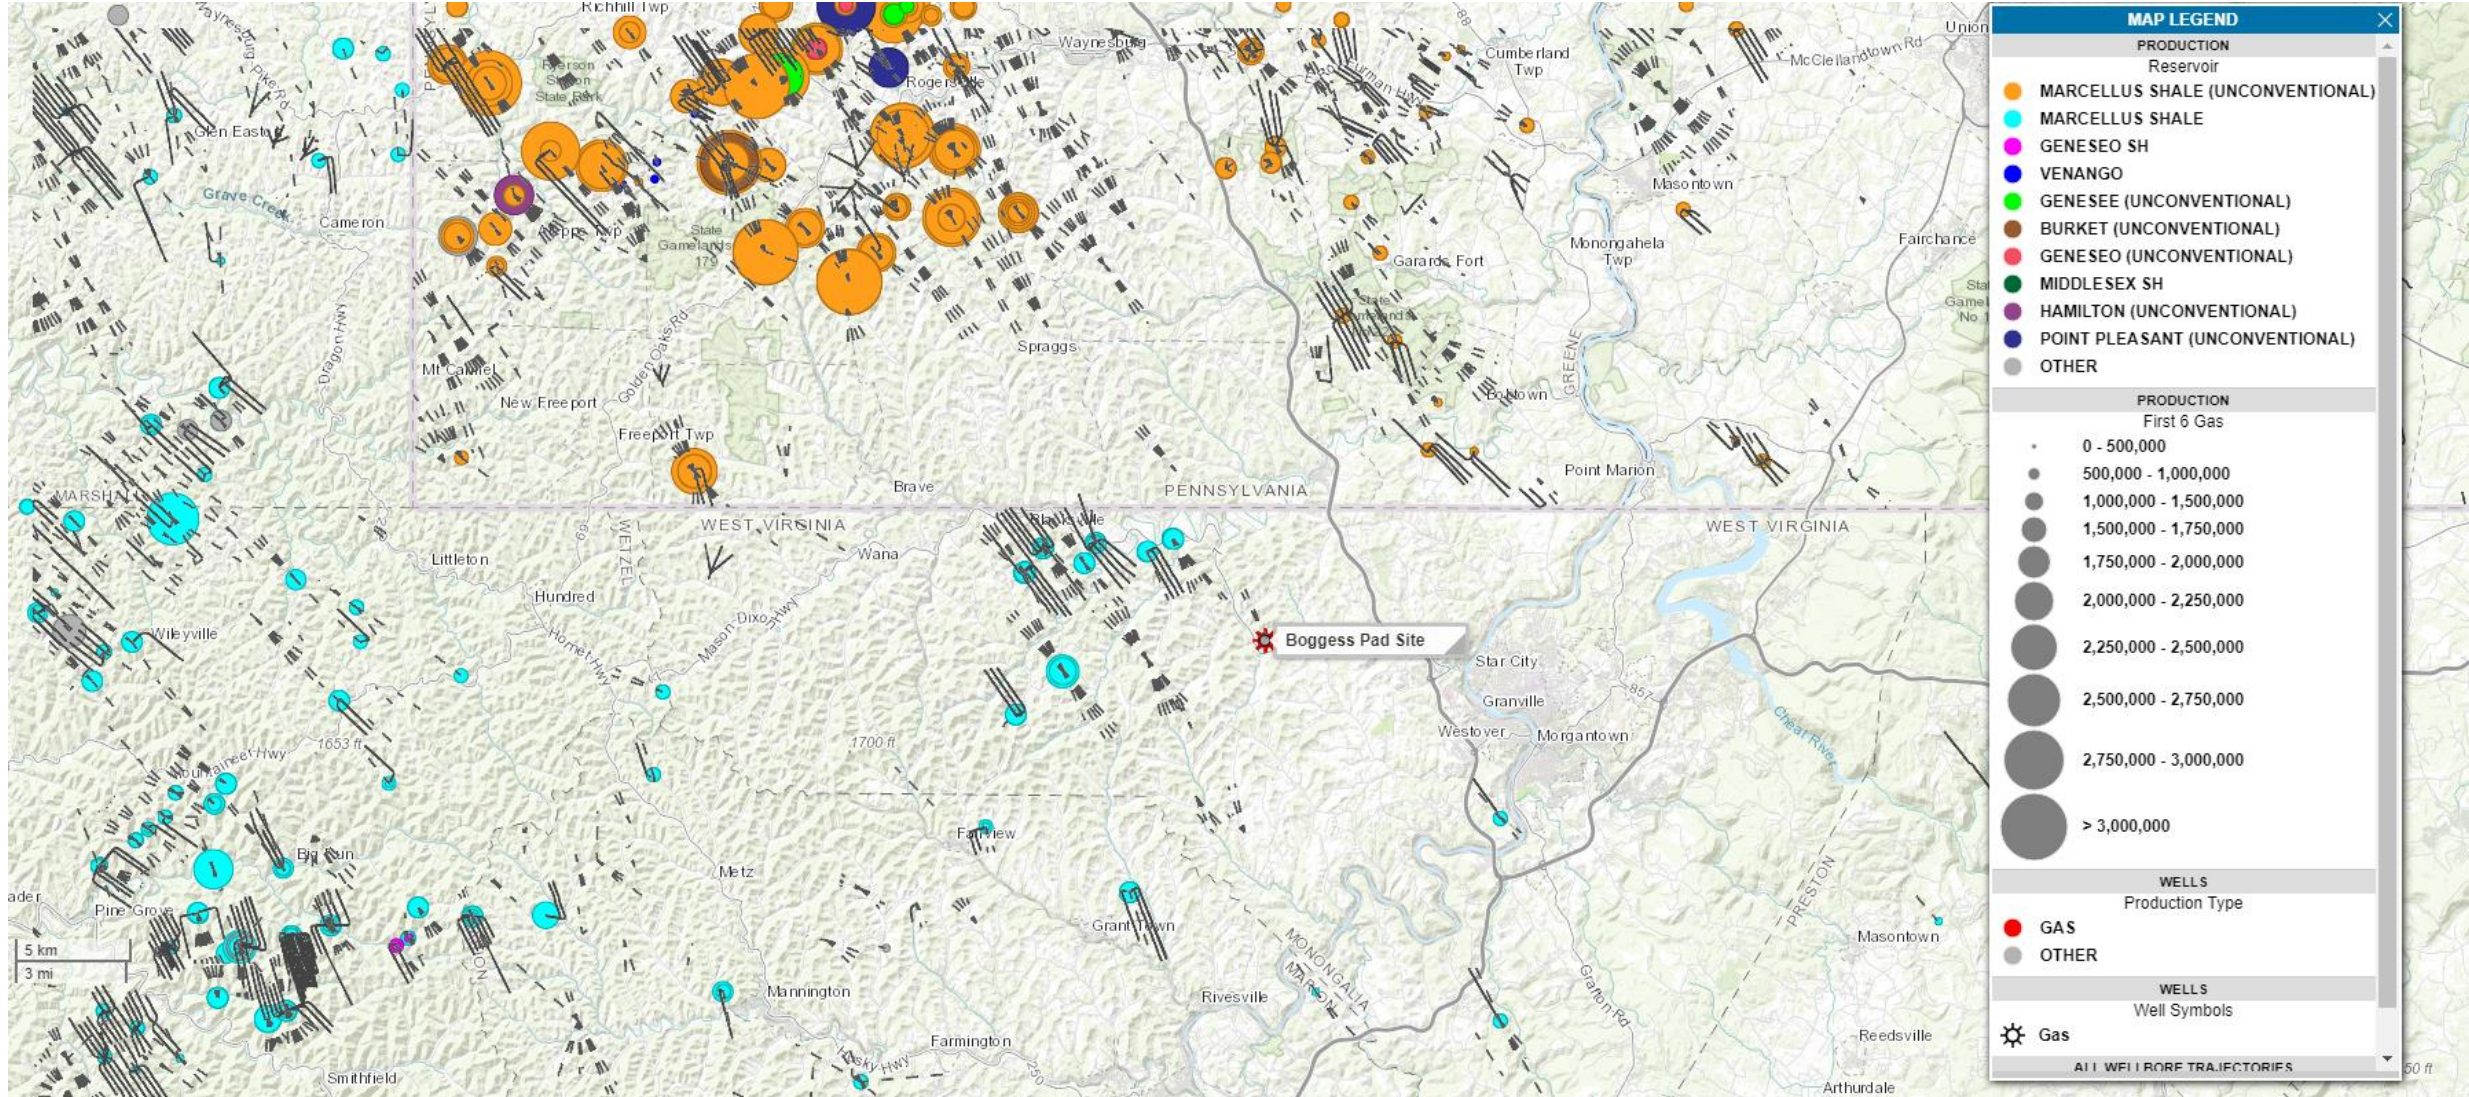

➤ OmniLog Overview

- Introduction
- Color Reference Index
- Quality Reference
- Trajectory Plot
- Well Overview – OmniLog with GR
- Geosteering Interpretation
- OmniLog Observations

➤ D2F Summary

- Summary conclusions
- Next steps

Area Map – First 6 months Gas by Reservoir

Input Data Provided

- Drilling data inclusive of standard parameters such as WOB, ROP, Torque, RPM etc.
- Directional data for well trajectory definition.
- Drilling report summary
- GR (drilling)
- Geosteering interpretation

OmniLog Overview

Introduction

- Drilling data is used to generate a RockMSE profile.
- Correction methodologies and algorithms (beyond the typical filtering, smoothing and de-spiking) are used to generate a RockMSE profile that more accurately represents the formation.
- The OmniLog comprises the final computed RockMSE along with any other available data (GR from the MWD, Mud Log Lithology, Gas shows from Mud Logs, Casing tally information etc.) and provides an insight to the geomechanical heterogeneity along the lateral.
- The OmniLog is presented on Driller's Depth.

OmniLog Color and Quality Reference

RockMSE Color Reference Index

Quality Reference Table

Color Code	Quality Reference	Description
	Excellent	No Data Editing Required; High Level of Confidence in RockMSE Results
	Good	Some level of Data Editing Required; Good level of Confidence in RockMSE Results
	Poor	Quality of data is poor across large sections; Significant data editing required; Low confidence of results in RockMSE; Use with caution

Example Quality Reference Track

OmniLog Observations & Summary

- Data was of reasonably good quality across both wells, though there were several sections impacted by null values, missing data and spikes.
- With our modeling workflow we were still able to generate a high quality OmniLog model for both wells
- Hardness levels and Heterogeneity are consistent with other Marcellus wells.
- There is generally good correlation with GR across most of the laterals.

Conclusions & Discussion

- Data quality & results are appropriate for intended purposes - Optimizing stage & perf placement & Comparison with other data sources
- Next steps for PerfAct completion design using OmniLog
 1. Confirm baseline completion design – stage length, clusters per stage, etc.
 2. Establish tolerances for optimization on above
 3. Identify additional data to include in optimization
 4. Establish timelines for completion
